The photo on the left shows the effect of wind on the self-cleaning of a photovoltaic panel. In addition to less dirt on the protected panel, rain and wind also contribute to cleaning.

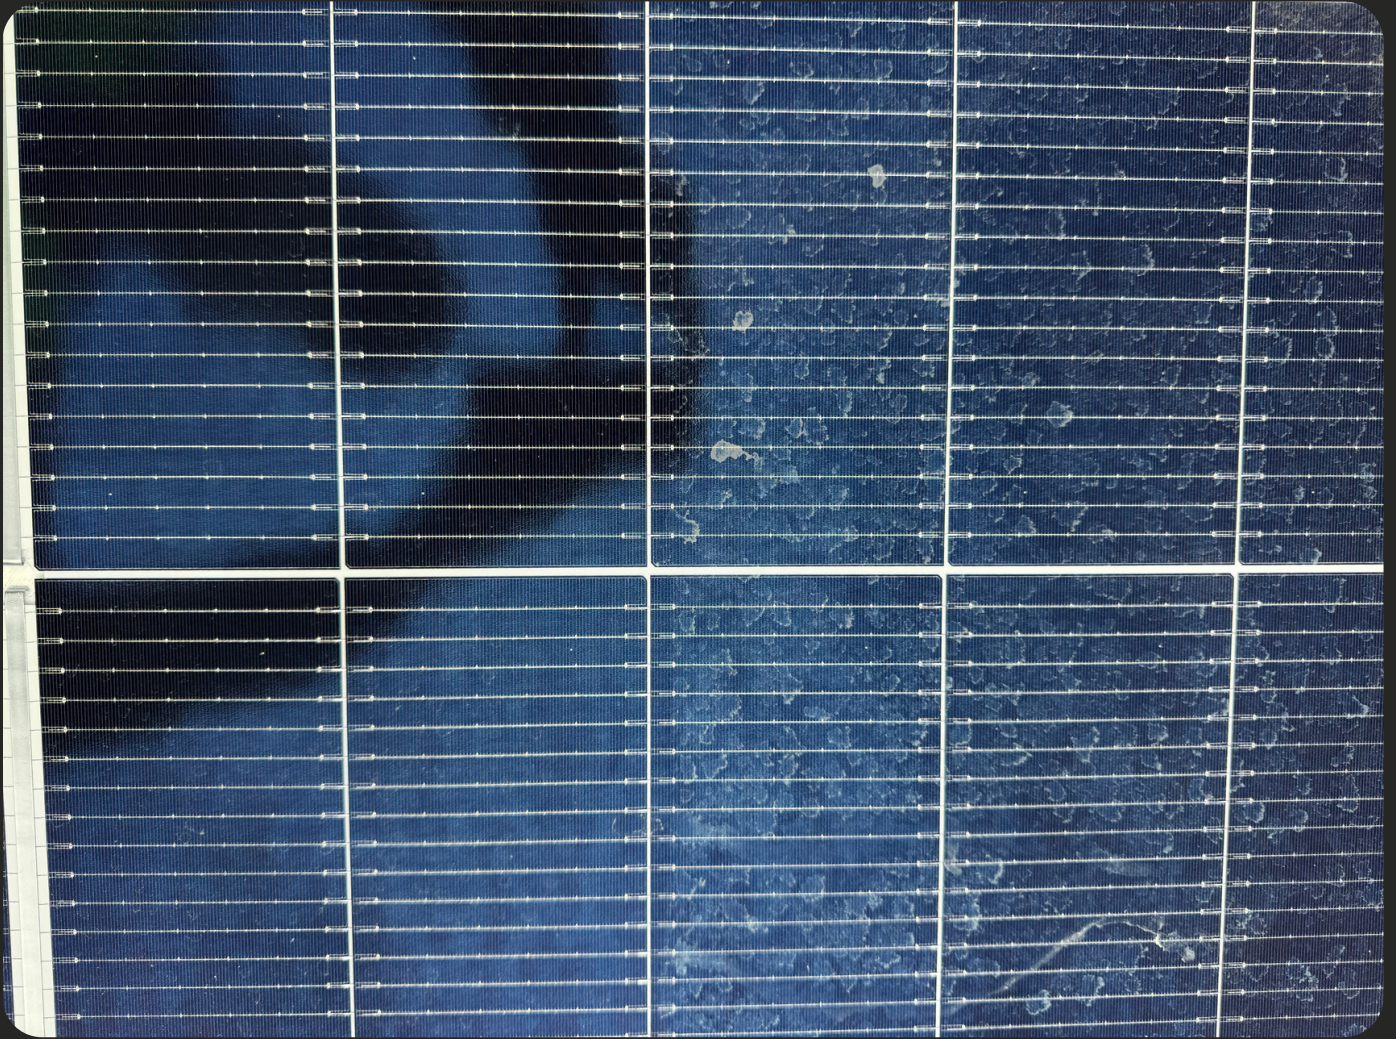

Photos taken 5 days after installation, during the building of the farm and the harvest.

Protected

Not Protected

The photo shows the absence of water spots after rain (on the protected side of the panel), i.e., limescale deposits on the top layer of the panel.

The panel was cleaned with a cloth to remove dust 5 days after installation.
